

Workflow Architecture Questions

- What are your different types of data?
 - How much storage capacity is required for each type?
- How can or should you separate your data?
 - How many different storage volumes are required?
 - What is the minimum number of volumes?
 - What is the ideal number of volumes?
- How should you configure your volumes?
 - What are the recommended block sizes?
 - What are the cache sizes?
- What are the data access patterns for the application or workflow?
 - Which data is accessed randomly and which data is accessed sequentially?
- What are the performance requirements?
 - What is the required minimum latency that can be tolerated by the application, workflow, or process?
 - What are the throughput and IOPS performance requirements?
 - How do the performance requirements apply to different types of data?
 - How do you measure this performance?
- What is the number of concurrent users or concurrent operations?
 - How does the number of users or concurrent operations affect performance?

Workflow Architecture Questions

- What are the requirements for data persistence and durability?
 - Is there temporary data that does not need to persist?
- Does that data need to be shared?
 - If so, which services need to share the data?
 - How does it need to be shared?
